NOTICE

This report was prepared by General Electric (GE) as an account of work done in conjunction with Commonwealth Edison (CECO) and sponsored by Electric Power Research Institute, Inc. (EPRI). Neither EPRI, members of EPRI, CECO, General Electric, nor any person acting on behalf of either: (a) Makes any warranty or representation, express or implied, with respect to the accuracy, completeness, or usefulness of the information contained in this report, or that the use of any information, apparatus, method, or process disclosed in this report may not infringe privately owned rights; or (b) Assumes any liabilities with respect to the use of, or for damages resulting from the use of, any information, apparatus, method or process disclosed in this report.

ABSTRACT

This report contains the design and operating data needed to define the fuel characteristics and reactor operation characteristics for Cycles 1 and 2 of the Quad Cities 1 reactor. The purpose is to provide reference quality data for use in the qualification of reactor core analysis methods and to provide the basis for the assessment of the irradiation environment of the plutonium recycle assemblies present.

The design data includes fuel assembly description, core component arrangements, control rod descriptions and core loading patterns. Hydraulic characteristics of the assemblies and the inlet orifices are also provided. Operating data is compiled for 16 steady-state points during Cycle 1 and 13 during Cycle 2. Each state point includes core average exposure, thermal power, pressure, flux, inlet subcooling, control configuration and axial in-core detector readings. In addition, benchmark cold critical data is specified.

PREFACE

This report is one of a series of compilations of reactor design and operating data which is being prepared for EPRI. The purpose of this series is to provide reference quality data for use in the qualification of reactor core analysis methods. In this case the data also provides the basis to allow for the assessment of the irradiation environment of the plutonium recycle assemblies present in the Quad Cities Unit 1 BWR.

A companion report, NP-214, (Gamma Scan Measurements at Quad Cities Nuclear Power Station Unit 1 following Cycle 2) covers detailed reactor power distribution data measured under EPRI sponsorship.

*Burt A. Zolotar
EPRI Project Manager*

I. INTRODUCTION

Under RP497-1, General Electric Company agreed to provide the design and operating data needed to define the fuel characteristics and reactor operating characteristics for Cycles 1 and 2 of the Quad Cities 1 reactor. The compilation of these data has been completed and this topical report furnishes the data.

The fuel and core design data were extracted from appropriate reports and drawings and, in general, all of the data requested are provided. Almost all of the operating data provided were obtained directly from process computer output edits. Although some of the data requested were not available, the data provide a relatively complete definition of the operation of the reactor through Cycles 1 and 2.

II. DISCUSSION

A. CORE AND FUEL DESIGN DATA FOR CYCLES 1 AND 2 OF QUAD CITIES 1

1. Fuel Assembly Descriptions

- a. Bundle design data for Type 1 initial fuel, Type 2 initial fuel, spatial Gd₂O₃ variation in initial fuel, 7x7 reload fuel, 8x8 reload fuel, and MO₂ fuel assemblies are included as Figures 1 to 7.
- b. Fuel assembly lattice drawings, including detailed dimensions, for initial fuel Types 1 and 2 are included as Figures 8 and 9. Since the dimensional data for the 7x7 and 8x8 reload fuel assemblies are included in Tables 2 to 8, fuel assembly lattice drawings are not included for these assemblies.
- c. Tables 1 and 2 summarize fuel rod arrays, fuel rod pitch, rod-to-channel spacing, gap thicknesses, control augmentation characteristics, U weights, channel characteristics, and water/UO₂ volume ratios for the initial 7x7 assemblies and the reload assemblies.
- d. Table 3 provides core loading, assembly pitch, fuel pin pitch, spacer data, average fuel compositions, and fuel weights for all fuel assemblies during Cycles 1 and 2.
- e. Tables 4 to 11 include pellet and stack densities, Gd₂O₃ and UO₂ weights, pellet lengths, pellet o.d., cladding o.d., cladding thickness, and gas plenum lengths for all fuel used during Cycles 1 and 2.
- f. Table 12 includes spacer weights, end plug weights, upper and lower tie plate weights, fission gas plenum material weights, the alloy compositions recommended for nuclear analyses, and spacer placement identification.
- g. Figures 10 to 14 are assembly detail drawings for initial 7x7 fuel, reload 7x7 fuel, reload 8x8 fuel, MO₂ test fuel, and a channel outline drawing.

2. Control Rod Descriptions

- a. Table 13 contains physical data for the control rods including shape, pitch, stroke, control material, etc.
- b. Figure 15 is a schematic drawing of a cross section of a control blade.

3. Core Descriptions

- a. Table 14 identifies the total number of fuel assemblies, number of fuel assembly types, heat transfer surface area, total weight of U in the core, etc., for Cycles 1 and 2.

Table 15 presents the bundle type and identification core loading array for Cycle 1.

- c. Figure 16 is a core plan view showing the core loading pattern by fuel assembly type for Cycle 1.
- d. Table 16 presents the bundle type and identification core loading array for Cycle 2.

4. Thermal Hydraulics

- a. The hydraulic characteristics of 7x7 and 8x8 fuel assemblies are presented in Figures 17 to 20 as functions of active coolant flow, active coolant power and subcooling. These data may be applied over a pressure range of 1035 ± 100 psia. Bundle pressure drop is somewhat insensitive to axial power distribution. The data are based on a distribution peaked at the middle with a peak-to-average value of 1.5. With a bundle flow of 130×10^6 lb/hr, bottom-peaked axial (3/8 point of active fuel length) will yield a pressure drop about 0.66 psi larger. A top-peaked axial yields essentially the same pressure drop as the middle peaked axial.
- b. The pressure drop characteristics of the central and peripheral region orifices are presented as functions of active coolant flow on Figures 21 through 24.

5. Core Components, Elevation Drawings, etc.

- a. Figure 25 is a drawing showing the elevation of certain core components.
- b. Figure 26 provides additional core elevation, arrangement, and component information.
- c. Figure 27 is a drawing of the top guide.
- d. Figure 28 is a drawing of the orificed fuel support.

6. Instrumentation Data

- a. A detailed LPRM in-core assembly cross section is included as Figure 29.

B. OPERATING DATA FOR CYCLES 1 AND 2 OF QUAD CITIES 1

1. Rod Withdrawal Sequences

Figures 30 to 33 present the rod withdrawal sequences for Quad Cities 1.

2. Benchmark Operating Data for Cycles 1 and 2

Data Sets 01 to 16 contain the reactor data for 16 selected operating states during Cycle 1 and Data Sets 17 to 29 contain the reactor data for 13 selected operating states during Cycle 2. Each data set contains the following data: date, core average exposure, core thermal power, core pressure, core flow, inlet subcooling, control configuration, and complete axial TIP distribution data for all 41 LPRM string locations. The TIP data are the full power adjusted, commonly normalized TIP readings at 6-inch intervals up the length of the assembly. They were obtained directly from the process computer and no adjustments, other than the previously mentioned full power and common position normalization, have been applied. The experimentally determined common position normalization is applied to normalize the data from the different TIP machines so that they produce the same readings when operated in the common position. The TIP data read from bottom to top of core. That is, the first entry is for the bottom 6-inch node. Exposure can be accumulated by using the calculated core power distribution for each of the data sets provided to advance to the next operating state. When a control rod sequence change is encountered between data sets, the exposure may be advanced to the sequence exchange date, and the data set after the exchange used to advance the exposure to the date of the data set immediately following the exchange date. Experience has shown that taking exposure steps finer than 700 MWd/t does not significantly add to the tracking accuracy (see Table 17).

All of these data were taken during steady-state operation. The reactor had been operating for at least 48 hours with essentially constant power, flow, and rod pattern before the data were accumulated.

Core thermal power, inlet subcooling, and recirculation flow rate are important to the reactor data evaluation. The values for these items were taken directly from process computer P1 output. The P1 output does not contain the detailed data used to calculate the output values and the detailed data are normally not available from the plant data (i.e., special edits must be requested or special readings taken). Therefore, the detailed data cannot be provided. However, the method used by the process computer to compute the values is:

a. Core Thermal Power

The core thermal power is obtained from the process computer which writes an energy balance on a system composed of the reactor vessel, recirculation loop piping, and cleanup demineralizer piping. Flows entering the system are the reactor feedwater flow, which is assumed to enter in two branches, and the control rod drive system flow. The only flow assumed to be leaving the system is the primary steam flow. Non-flow power inputs are the fission power (core thermal power) and recirculation pumping power; non-flow power losses are the radiative power loss and the net power transferred across the boundary of the cleanup demineralizer loop.

b. Core Inlet Subcooling

The core inlet subcooling is obtained from the process computer by writing an energy balance on the core downcomer (the volume between the core shroud and the vessel wall, and including the external recirculation and cleanup loops), yielding:

$$W_T h_o = w_{rl} h_f + w_{rs} h_g + w_{fw} h_{fw} + w_{cr} h_{cr} + (Q_p - Q_{cu}) C_i$$

where:

W_T = flow rate entering core inlet plenum (exhausting from jet pumps), Mlb/hr

h_o = Core inlet enthalpy (enthalpy of W_T), Btu/lb

w_{rl} = flow rate of saturated liquid entering downcomer, Mlb/hr

h_f = saturated liquid enthalpy, Btu/lb

w_{rs} = flow rate of saturated steam entering downcomer (i.e., "carryunder"), Mlb/hr

h_g = saturated steam enthalpy, Btu/lb

w_{fw} = feedwater flow rate entering reactor at top of downcomer, Mlb/hr

h_{fw} = feedwater enthalpy, Btu/lb

w_{cr} = control rod drive system flow, Mlb/hr

h_{cr} = enthalpy of control rod drive system flow, Btu/lb

Q_p = power added to downcomer fluid by recirculation pumps, MW

Q_{cu} = power removed from downcomer fluid by cleanup demineralizer system, MW

C_i = conversion constant = 3.413 MBtu/MWh

The total flow entering the inlet plenum is:

$$W_T = w_{rl} + w_{rs} + w_{fw} + w_{cr}$$

c. Recirculation Flow

The reactor core flow rate is monitored by the process computer by direct measurement of differential pressure across the jet pump diffusers. For illustrative purposes, the 20 jet pumps can be divided into four groups of five each. A typical group is shown in Figure 34. In each group, one jet pump contains a diffuser with two static pressure taps. The remaining four units contain only one pressure tap. The "double tapped units" are calibrated by test prior to installation to determine the relationship between flow and differential pressure. This information is used to perform in-reactor calibration of the "top tap-to-lower plenum" pressure difference of all 20 jet pumps. After this calibration procedure has been completed, the total core flow is measured by electrically analyzing the signals from the single tap-to-lower plenum pressure transducers on all 20 jet pumps. The resulting total core flow rate output signal is displayed on the reactor control board. In addition, the ΔP signals described above are available in the control room.

3. Benchmark Cold Critical Rod Pattern Data for Cycles 1 and 2

Benchmark cold critical data are presented on Figures 35 to 39 for Cycle 1 and Figures 40 to 42 for Cycle 2. Each figure contains the following data for a cold, critical state: date, core average exposure, reactor water temperature, rod pattern, and rising period. The data were taken during startups following outages which were long enough to assure xenon-free conditions (>72 hours).

4. Operating Data Summary

Figures 43 to 84 present operating data summaries for each month during Cycles 1 and 2. The data presented include daily values of power level, flow, and rod notch inventory (rod notches inserted).

Spacer Placement

There are seven spacers in the initial and reload fuel assemblies. Their center positions above the bottom of the active fuel in inches are 18.5, 38.0, 57.5, 77.0, 96.5, 116.0, and 135.5. Each spacer is 1.625 inches long.

(Adjacent to Central Structure)	

Control Blade Position

Control blade insertion is calibrated in notches, where one notch equals 3 inches. Position of the control blade is described by the number of notches withdrawn. Thus, 0 notch implies full insertion and 48 notches implies full withdrawal. Total travel of the control blade is 144 inches, the same as the length of the active fuel. At full blade insertion (0 notch), the top of the control material is 1 inch below the top of the active fuel. At full blade withdrawal, the top of the control material is 1 inch below the bottom of the active fuel. Since the physical notches in the control rod drive are 6 inches apart, the control blade notch position is always even. For the control patterns shown, the numbers shown indicate notches withdrawn and no notch number implies a fully withdrawn blade or a notch position of 48 for power operating patterns and a fully inserted blade or a notch position of 00 for cold critical patterns.

CYCLE 1 DATA

DATASET 01, JUNE 29, 1972

Reactor Conditions

Core Average Exposure, 247.0 MWd/t
Core Thermal Power, 2184.88 MWT
Core Pressure, P, 1036.69 psia
Core Flow, 84.39 Mlb/hr
Inlet Subcooling at P, 18.88 Btu/lb

DATASET 04, NOVEMBER 1, 1972

Reactor Conditions

Core Average Exposure, 1334.0 MWd/t

Core Thermal Power, 2197.06 MWT

Core Pressure, P, 1039.41 psia

Core Flow, 97.58

Inlet Subcooling at P, 21.19 Btu/lb

Control Configuration

ATASET 05, DECEMBER 26, 1972

Reactor Conditions

Core Average Exposure, 2031.0 MWd/t

Core Thermal Power, 2450.00 MWT

Core Pressure, P, 1044.75 psia

Core Flow, 97.97 Mlb/hr

Inlet Subcooling at P, 23.34 Btu/lb

Control Configuration

DATASET 06, MARCH 8, 1973**Reactor Conditions**

Core Average Exposure, 2894.0 MWd/t

Core Thermal Power, 2413.91 MWT

Core Pressure, P, 1039.04 psia

Core Flow, 95.30 Mlb/hr

Inlet Subcooling at P, 23.52 Btu/lb

Control Configuration

DATASET 10, AUGUST 30, 1973

Reactor Conditions

Core Average Exposure, 4809.0 MWd/t

Core Thermal Power, 2337.00 MWT

Core Pressure, P, 1020.02 psia

Core Flow, 90.95 Mlb/hr

Inlet Subcooling at P, 23.42 Btu/lb

Control Configuration

ATASET 11, NOVEMBER 1, 1973

Reactor Conditions

Core Average Exposure, 5471.0 MWd/t

Core Thermal Power, 2014.00 MWT

Core Pressure, P, 1010.17 psia

Core Flow, 73.50 Mlb/hr

Inlet Subcooling at P, 25.14 Btu/lb

Control Configuration

DATASET 12, DECEMBER 11, 1973**Reactor Conditions**

Core Average Exposure, 5949.0 MWd/t

Core Thermal Power, 2225.50 MWT

Core Pressure, P, 1029.82 psia

Core Flow, 97.89 Mlb/hr

Inlet Subcooling at P, 21.22 Btu/lb

Control Configuration

CYCLE 2 DATA

DATASET 17, JULY 26, 1974

Reactor Conditions

Core Average Exposure, 6625.0 MWd/t
Core Thermal Power, 1422.73 MWT
Core Pressure, P, 980.754 psia
Core Flow, 49.33 Mlb/hr
Inlet Subcooling at P, 27.69 Btu/lb

Control Configuration

Legend: 48, Full Out; 0, Full In.

DATASET 18, AUGUST 15, 1974**Reactor Conditions**

Core Average Exposure, 6833.0 MWd/t

Core Thermal Power, 2171.47 MWT

Core Pressure, P, 1024.20 psia

Core Flow, 83.83 Mlb/hr

Inlet Subcooling at P, 24.02 Btu/lb

Control Configuration

DATASET 22, DECEMBER 11, 1974**Reactor Conditions**

Core Average Exposure, 8293.0 MWd/t

Core Thermal Power, 2500.22 MWT

Core Pressure, P, 1049.39 psia

Core Flow, 96.68 Mlb/hr

Inlet Subcooling at P, 24.20 Btu/lb

Control Configuration

ATASET 23, APRIL 3, 1975**Reactor Conditions**

Core Average Exposure, 9229.0 MWd/t

Core Thermal Power, 2463.00 MWT

Core Pressure, P, 1052.66 psia

Core Flow, 97.23 Mlb/hr

Inlet Subcooling at P, 23.74 Btu/lb

Control Configuration
